Healthy digestive and immune system.

14 beneficial bacterial strain formula benefits.

When it comes to the health of your dogs – especially keeping their sensitive digestive systems happy and working well – there is one option that is finally receiving the recognition it deserves.

It's a solution that may provide the occasional gastrointestinal relief and daily support your dogs need to help maintain their active lifestyle.

[Complete Probiotics for Pets](#)

[Joint Support for Pets](#)

[Krill Oil Liquid Pump for Pets](#)

It's also a healthy choice that gives you a dogs.

It's a fact: Bowel health is one of the top 10 reasons dog owners bring their dog to the vet for health care.

Vets see dogs with less-than-optimal bowel health every day.

But it doesn't have to be this way....

Studies by traditional veterinarian's supports the fact that supplementing your dog's diet with multi-strain probiotics is an

essential way to help maintain and promote their optimal gastrointestinal health.

With a healthy GI system, your dog can potentially:

Achieve peak strength, fitness and vigor.

Maximize optimum health and well-being no matter what stage of life they're in.

Fully enjoy a rich life of companionship with you.

Supporting your dog's gastrointestinal health is a key factor in helping to make sure the dog is living the best life possible.

Research indicates that a complete pet probiotic can and do promote:

Overall gastrointestinal maintenance and health.

Faster promotion of gut health.

Helps coping with external stresses.

The term *probiotics* originates from the Greek word that means "for life."

When ingested, these living microorganisms replenish the microflora in your pet's intestinal tract.

This results in the promotion of a number of health-enhancing functions, including enhanced digestive function.

So why does your puppies and dogs and especially your pregnant female need these health-enhancing functions.

The answer is *stress*.

Just like humans, your pet encounters emotional and physiological stresses ever day – and every one of these stresses can potentially affect her GI tract.

You see, as the largest immune barrier in the body, the gastrointestinal tract bears the brunt of these stresses.

Everything from eating sticks and grass to dietary changes experienced when being boarded or even just you being gone for the day can rock the delicate balance of good bacteria in your pet's gut, which opens the door to less-than-optimal health.

Then to top is all - adding to that, poor diet choices of highly processed pet foods as well as a stress-filled environment, and you can quickly

understand why supporting your pet's immune system, healthy digestion and overall good health is so important.

Your dog's digestive and immune systems want your help.

With so many challenges to your pet's health and well-being, it's no wonder bowel health questions are among the most common vets receive at their clinic.

You can help your pet's GI tract by supplementing their diet with probiotics that flood their system with the correct, beneficial bacteria, supporting their digestion, nutrient absorption and overall health.

Research suggests that probiotic therapy is effective, safe and a real way to promote total gastrointestinal health.

Know this! >> All pet probiotics are NOT created equal.

If you're like most concerned pet owners, you have many questions of what to look for in a pet probiotic, including:

How many strains of beneficial bacteria does my dog need?

How many beneficial bacteria per gram are best?

Are the viability, potency and purity of a probiotic important to know?

If so, how do I assess these factors?

How many strains of beneficial bacteria does my pet need?

Probiotics are considered "beneficial" or "good" bacteria. There are many different kinds, or strains, of these bacteria. Each works to create a healthy balance in your dog's gastrointestinal system.

Individual strands are helpful for maintaining overall health as well as uniquely responding to the variety of daily stressors, both emotional and physiological, that your pet encounters.

Research shows that 10 or more strains are recommended for promoting optimal health.

So if you find a pet probiotic product has one to two strains of bacteria – as is the case with many probiotics available today – that's fine. But selecting a probiotic that has 10 or more beneficial strains is a much preferred option.

Why? The more beneficial strains you have in your probiotic, the better able they are to respond to the wide variety of stressors that can affect your dog's gastrointestinal system.

How many beneficial bacteria per scoop are best?

The potency of your probiotic is very, very important. Knowing how many beneficial bacteria per scoop it has will potentially tell you how effective it can be.

As you know, your multivitamin can contain numerous vitamins and minerals, but if any of these ingredients are not included in at least the daily recommended allotment, their value may be limited.

So even if your probiotic contains numerous strands of beneficial bacteria, you need to make sure it also contains a sufficient number of bacteria per scoop.

Many products today contain between one and three million beneficial bacteria per scoop. This is OK, as any amount of probiotics can be helpful.

However, in my opinion, if you really want to make sure you're promoting optimal health and well-being, you can do far better. Ideally best you'll want to find a probiotic formula with 20, 30, 40 million or more beneficial bacteria per scoop.

Are the viability, potency and purity of a probiotic important to know? It's important as a pet owner for you to be able to know and trust exactly what's inside that probiotics bottle.

At best, you don't need to waste your time and money on products that don't have what your pet needs at the recommended potency. At worst, you cannot risk having "something" in there that is impure or could potentially be harmful.

Recent research has shown that many probiotics simply do not live up to their labels.

In more than 20 types of probiotics tested in one study, researchers found numerous instances of products that:

Did not contain at least 14 strains of bacteria.

Were contaminated with such things as mold.

Had misspellings of the bacteria included.

Misidentified the bacteria included with outdated names and/or "nonexistent" strands.

Did not have any live bacteria organisms, which are needed to be considered a probiotic at all.

Did not include the number of live bacteria that could be expected to be contained based on the expiration date.

So how do you assess the viability, potency and purity of a probiotic?

The best way is to find a probiotic that is manufactured in a facility that has received the international certification for meeting or exceeding GMP requirements.

GMP, or Good Manufacturing Practice, regulations require that a manufacturer take proactive steps to help ensure their product is safe, potent, and pure, and that their manufacturing process is technologically adequate to avoid contaminations or errors.

But how can you tell if a probiotic has been manufactured in a facility with a GMP certification?

Because you will often not find this information on the label, you need to do your homework to make sure your selected probiotic has been produced in a facility that has this certification to help protect your pet by one of the highest standards in dietary supplementation.

To recap, as you look for the best in pet probiotics, you're looking for how many strands and how much bacteria per gram are available in the product and whether it is produced in a GMP compliant facility, which can help assure viability, potency and purity.

A top probiotic brings together 14 of the most powerful strains of beneficial bacteria and is manufactured in a facility that has earned the GMP compliance certification and contains a special blend of the appropriate strains that are most effective for promoting optimal gastrointestinal health in your cats and dogs.

Should contain:

Bifidobacterium lactis: a friendly bacteria often found in yogurt that is known to help support a healthy immune response.

Bifidobacterium animalis: a unique bacteria that promotes optimal health and intestinal well-being

Lactobacillus acidophilus: supports the health of your pet's entire digestive tract.

Bifidobacterium longum: keeps your pet's digestive system running smoothly by supporting proper digestion and bowel health.

Bifidobacterium bifidum: helps promote a healthy balance of flora in your pet's intestine. What's more, this organism is especially helpful for enhancing immune response.

Lactobacillus casei: works with other helpful organisms and helps to encourage the growth of other "good" bacteria.

Lactobacillus plantarum: helps to ensure that the nutrients in vitamins and supplements are getting to your pet's cells.

Know and be impressed with the concentrated pet probiotic formula of the product:

Lactobacillus rhamnosus: assists your pet's elimination and occasional intestinal discomfort by working to stabilize their intestinal microflora.

Lactobacillus bulgaricus: works with other *Lactobacillus* strains to provide your pet with a potential source of dietary antioxidants.

Bacillus coagulans: You get 38 billion bacterial "buddies" ready to help support you're their body.

The end result: You get 38 billion bacterial "buddies" ready to help support your pet's digestive

Probiotics can put your pet on the path to better health as long as you choose one that delivers all that it claims.

As said - not all pet probiotics on the market are created equal.

Probiotic bacteria found in today's products vary significantly in composition, biological activity and portion. Plus, as you've learned, how a product is manufactured can make a huge impact on its potency and, therefore, effectiveness.

Complete Probiotics for pet's products;

Benefits You Want	Good Probiotics product	Other Brands
Contains multiple strains of good bacteria?	YES – This concentrated formula brings together 14 different "good" strains, so your pet's GI tract gets many varieties of helpful organisms in one dose.	Many probiotics contain one or two strains that, on their own, may not be able to do enough. Other products also have competing strains that fight for the same resources, so you may not see the full benefit of the probiotics.
Delivers a potent formula?	YES – A minimum of 38 billion beneficial bacteria are packed in every scoop when used by the expiration date printed on the package.	Some probiotic formulas may contain only a few billion beneficial bacteria.
Manufactured to deliver live, viable organisms?	YES – This formula is manufactured to prevent heat, air and moisture from having an effect on the organisms.	Many "bargain" products are manufactured without consideration of exposing delicate organisms to heat, air or moisture – factors that can damage or destroy them.
GMP certified?	YES a top Probiotics for Pets is manufactured in a facility certified to be in full compliance with GMP requirements.	Many products are manufactured in facilities that do not receive this certification, so you can never be sure if your pet is really getting what you think. At best, you're just wasting money on an ineffective product. At

Benefits You Want	Good Probiotics product	Other Brands
Beneficial bacteria reach the small intestine?	YES – When you give this concentrated formula to your pet with his meal, you're delivering helpful bacteria into a stomach with a more favorable pH. These strains are known to survive and reach the small intestine.	worst, potential harm can result. Not all supplements include live organisms or clearly explain the way to take them for best results. Some acidophilus-based products may actually not survive your pet's stomach acidity.
Easy to store	YES – The product does NOT need refrigeration, making it convenient to store.	Many require refrigeration, making them impractical or inconvenient to store where you feed your pets.
Meets the criteria for a beneficial probiotic: 1. Survives stomach acid 2. Has health-promoting features 3. Promotion of probiotic preservation through manufacturing	YES – Because this product passes all of these criteria, it can be considered a beneficial probiotic.	Many probiotics aren't as beneficial in that they don't deliver on all of the criteria. Whether it's the strains they contain, the way they are manufactured, or the fact that some just don't survive the rigors of your pet's stomach acid, it's important for you to be aware and know if your pet is getting the "true" value of probiotic supplementation.
